

Adolescent Brain Cognitive Development

FAQ

- **We already have the access to the ABCD project data. Do we need to apply for the access to the abcd-np-challenge data again?**
No
- **Why are their negative prediction scores?**
Scores are residualized on socio-demographics, brain volume and site. Since the regression model used to do the residualization includes an intercept, the values are centered more or less around zero, Since subtracting the mean value from all observations should be irrelevant for prediction purposes, the fact that values are both negative and positive shouldn't present any issues for prediction algorithms.
